

unTRaPPED icon set — addendum: the remaining 11

Date: 7 September 2026 · Read with: unTRaPPED-designer-brief.pdf (full rationale)

1. The parking icon is approved — build the rest to match it

We measured the file off the live map (not the artboard) and it passes. Use it as the reference for everything else: one white outline, flat colour, two-layer rating dot, long stem, artwork filling the canvas.

Two things you do **not** need to change: the border weight is slightly under spec but we tested it and the gain is not worth a round on its own, and the letterform proportions are yours to keep — they work.

2. Two changes since the brief you were working from

These are the important ones. Everything else is unchanged.

2.1 Venues are no longer blue

Blue is now reserved for the two things people *scan the map hunting for* — Parking and Toilets. Venues and Routes are things you assess once you already know where you're going, so they take the rating colour as the whole shape.

Family	Icons	Body colour	Rating shown by
Facilities you hunt for	Parking, Toilets	always blue	small dot, bottom-right
Things you assess	Routes, Venues	green / orange / red	the whole shape — no dot

So only six of the twelve carry a rating dot. Routes and Venues have none at all.

2.2 The rating dot moved to the BOTTOM-right

It was top-right. It has to move, and the reason is the "T": a **T's crossbar occupies the entire top of the letter**, so a top-right dot lands on the end of the crossbar and eats it — at 18px it reads closer to an "F". Bottom-right is the only corner genuinely empty in both "P" and "T".

3. The remaining 11

#	Icon	Shape	Body	Glyph	Dot
1	Toilet – good	Pin	Blue	White T	Green, bottom-right
2	Toilet – caution	Pin	Blue	White T	Orange, bottom-right
3	Toilet – barriers	Pin	Blue	White T	Red, bottom-right
4	Parking – good	Pin	Blue	White P	Green, bottom-right

#	Icon	Shape	Body	Glyph	Dot
5	Parking – barriers	Pin	Blue	White P	Red, bottom-right
6	Route – good	Circle	Green	White moving wheelchair	none
7	Route – caution	Circle	Orange	White moving wheelchair	none
8	Route – barriers	Circle	Red	White moving wheelchair	none
9	Venue – good	Square	Green	White wheelchair	none
10	Venue – caution	Square	Orange	White wheelchair	none
11	Venue – barriers	Square	Red	White wheelchair	none

(Parking – caution is the approved sample, already delivered.)

unTRaPPED map icon set - the 12, as specified

512 -> 128 -> 18px, the real pipeline. Small square left of each row = ACTUAL size on the map.

PARKING

blue + white P + rating dot

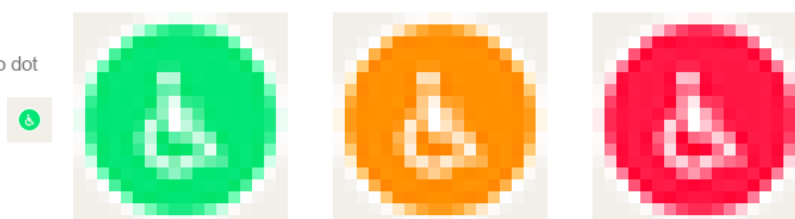

TOILETS

blue + white T + rating dot

ROUTES

whole circle takes the rating colour, no dot

VENUES

whole square takes the rating colour, no dot

The full set at actual rendered size. The wheelchair shown is a stand-in from a system font and is deliberately too detailed - it is what NOT to do. The P shows the intended weight.

4. Colours — one palette does both jobs

Rating	Hex
Green	#00E676
Orange	#FF9100
Red	#FF1744

These are the **dot** colours on Parking and Toilets **and** the **body** colours on Routes and Venues. Same values both places, so a red venue and a red parking dot are unmistakably the same red.

5. The two icons most likely to give trouble

5.1 The "T" — watch the crossbar

The T is top-heavy and its crossbar runs the full width of the letter. It has no enclosed counter, so it can go **larger than the P** — up to about 0.74 of the pin-head width. Keep the dot clear of the crossbar's right arm; bottom-right does this, top-right does not.

5.2 The wheelchair — the riskiest shape in the set

It is the only glyph with real internal detail, and it appears on **six** icons. A standard system wheelchair symbol turns to mud at 18px — we tested one and it is unreadable.

- Draw a **simplified, heavier** wheelchair, not a traced accessibility symbol.
 - The **head, back and wheel arc** are what make it recognisable. Footplates, spokes, arm detail and gaps under 1.5px on screen are not — drop them.
 - It is white on a saturated colour, so you have full contrast to work with. Use it.
-

6. The rule that governs all of it

Every element has a minimum surviving size, and the enclosed holes fail first.

Icons display at **18 x 18 px** — always, at every zoom. Google re-encodes your 512px file to 128px first, so check every glyph by downscaling **512 -> 128 -> 18**, not in one step, and never judge it on the artboard.

Concretely: **keep any enclosed counter or gap at least ~40px on the 512 canvas** — about 10px at 128, about 1.5px on screen. Below that it fills in and the shape becomes a blob. This is what sets the limit on the P's stem, and it is what will decide whether the wheelchair works.

How long should the P's stem be?

Cap height held CONSTANT - only the bowl/stem ratio changes. 512->128->18px.

Arial Black 'P' (what we specced)

bowl 0.64 - short stem

bowl 0.58 - medium

bowl 0.52 - long stem

bowl 0.46 - counter has closed

Why counters fail first: cap height is identical in every row, only the bowl/stem ratio changes. In the bottom row the counter has closed and the letter is a blob.

7. Delivery

- **PNG, transparent background, 512 x 512**, artwork filling the canvas edge to edge
- Individual files, not a combined sheet

- Plus the **editable source** (AI / SVG / Figma)
- Naming by rating colour:

toilet-green.png	parking-green.png	route-green.png	venue-green.png
toilet-orange.png	parking-red.png	route-orange.png	venue-orange.png
toilet-red.png		route-red.png	venue-red.png
